

Submission Guidelines for Participants

- Installable APK
- Source code repository
- Demo video (≤ 5 min)
 - Must show, unedited and in order:
 - a) teaching one flow by voice + taps,
 - b) replaying it with the exact utterance,
 - c) replaying with a paraphrase,
 - d) replaying with a changed slot value, (e) the assistant asking the user a question when stuck.
- Architecture
 - How you do speech-to-intent, UI-tree capture, generalisation, slot extraction, and replay.
 - Diagrams
- Target apps declaration
- Known limitations

Core capabilities

- Android only; automation must go through Accessibility Service / UI Automator-style APIs. No app-specific SDKs, deep links as a substitute for taps, or web fallbacks.
- **No hard-coded flows.** Judges will teach a new flow live; anything that only works on pre-baked scripts scores zero on generalisation (T2-T9).
- **No credential capture.** The system must pause and hand control to the user on any payment, OTP, password or login screen.
- **Parametrized Flows** – should be able to detect variations in parameters for same flow, for example Learned flow for “Order a Margherita Pizza from dominos” should work for “Order garlic bread from dominos”
- Should be able to detect change in condition and proceed themselves or ask user for confirmation (T7)

Bonus Points

- Should be able to detect non-required/unnecessary touches. It should discard if user has made some mistake, touches not required for that use case. For example if user is teaching how to order a pen, and receives a call, it should discard the action of user disconnecting the call. **(+3)**
- Generalization of workflow across similar apps/similar UIs, for example teaching a workflow on Amazon should also work for similar e-commerce sites like Myntra. **(+4)**
- Mid-flow parameter identification and clarification: When a learnt workflow matches the user's intent but a required parameter is missing or ambiguous, the system should recognise the gap, ask the user to fill it, and then continue the flow. For example, if the user says "Order a pizza on Zomato" and the assistant has previously learnt to order from a specific restaurant, it should recognise that the restaurant is a parameter of the flow rather than a fixed step, ask the user which restaurant they want, and proceed with their answer. **(+3)**

Test Cases

ID	Case	Judge action	Expected behaviour	Pass criteria	Score
T1	Teach - food	Say: <i>"Order a Margherita pizza from Domino's on Zomato."</i> Then perform the taps once, stopping at the payment page.	System records the command + steps, confirms learning ("Learned: order Margherita pizza from Domino's"), and stores it.	Flow is saved; confirmation shown; recorded steps are inspectable.	5
T2	Exact replay	Repeat the T1 utterance verbatim.	Reaches payment page unattended with the same item in cart.	Correct item, correct restaurant, stops at payment.	5
T3	Paraphrase	Say: <i>"Get me a margherita from dominos"</i> and <i>"I want to order margherita pizza on zomato."</i>	Both map to the T1 flow and replay successfully.	2/2 recognised and executed. Partial credit for 1/2.	6 (3 each)
T4	Slot: item	Say: <i>"Order a Farmhouse pizza from Domino's on Zomato."</i>	Same flow, different item searched/selected.	Farmhouse (not Margherita) in cart.	4
T5	Slot: quantity	Say: <i>"Order two Margherita pizzas from Domino's."</i>	Quantity set to 2.	Cart shows qty 2.	4
T6	Slot: address	Say: <i>"Order a Margherita from Domino's, deliver to work."</i> (test account has "Home" and "Work" saved).	Address switched to Work.	Correct address selected on checkout.	4
T7	Screen change	Judge pre-triggers a state change before replay (e.g. Domino's now shows a promo pop-up on open, or the account has an item already in	System dismisses/handles the pop-up or clears/proceeds sensibly, or asks the user a specific question.	Reaches payment correctly, or asks a relevant question (not a generic "something went wrong").	6 (full: handled autonomously; 3: asked a relevant question)

		cart). Repeat T2.			
T8	Teach - e-commerce	Say: <i>"Search for wireless earbuds on Amazon and add the first result to cart."</i> Perform taps once.	Second flow learned in a second app.	Saved, distinct from T1.	4
T9	Cross-app slot + replay	Say: <i>"Search for a phone case on Amazon and add the first result to cart."</i>	Flow generalised across search term.	Correct item in cart.	4
T10	Genuinely stuck	Judge changes account language to Hindi (or logs out of the target app), then repeats T2.	System detects it cannot proceed and asks the user, rather than tapping wrong elements or looping.	Asks a clear question or reports a specific failure within 30 s; no destructive wrong taps.	5
T11	Credential boundary	Repeat T2 and let it reach payment.	Stops, hands control back, clearly indicates "your turn".	No taps on payment/OTP screen; explicit hand-off.	5 (fail = -10)
T12	Negative / unknown intent	Say: <i>"Book a cab to the airport."</i>	System says it hasn't learned this and offers to be taught.	No attempt to run an existing flow.	3
T13	Ambiguity	Say: <i>"Order pizza."</i>	System asks <i>which</i> flow/ <i>which</i> pizza, or picks the closest with confirmation.	Asks or confirms; does not silently guess wrong.	2
T14	Reporting	After T2 and T10, ask: "Did the last run succeed?" or check the UI.	Clear success/failure status with the step where it stopped.	Accurate report.	3
